PLANQK Docs

Implementation Settings

In this section you will learn how to manage the settings of your implementation.

Change visibility

When you create your implementation it is *private* by default. Unless the implementation is owned by an [organization](#), you are the only one who can see your implementation and update any code. In the settings of your implementation you can change the visibility to *public*. *Public* means that all PLANQK users can see your implementation and its code. However, they are not allowed to make any changes to your implementation.

Managing Members

If you want to grant certain users access to your implementation, you can add them as members. A member can have the role *Viewer*, *Maintainer* or *Owner*.

- Viewer: Can see the implementation and its code, but cannot make any changes.
- Maintainer: Has all the rights of a Viewer and can make changes to the code.
- Owner: Has all rights of a Maintainer and can manage the implementation settings, e.g., adding users, changing the visibility, and deleting the implementation.
